

## internet for small business

**TURN WIRELESS PROVIDES A HOST OF SERVICES TO HELP BUILD AND MAINTAIN  
DEPENDABLE, COST-EFFECTIVE SMALL BUSINESS INTERNET ACCESS.**

There are a variety of options available for small business internet needs today, ranging from DSL, cable, fractional-T1 or full T1 circuits. However there are still many obstacles associated with these choices namely availability and price. Many businesses are unable to get DSL coverage and when available may not meet their needs of reliability, bandwidth, network services and support. When it comes to circuit throughput there are many DSL services that offer "burstable" capacity that claims to "reach" T1 speeds of 1.5 Mbps or higher without actually having the ability to do so on a consistent level. With large rates of oversubscription, lack of dedicated throughput and no service level agreements the risks to some business are just not acceptable. On the other hand to consider a traditional T1 introduces a high cost of service creating a situation that can be difficult to get around.

Our ability to offer internet access for small business needs focuses around our turnpipe 768K, 1Mbps and 2Mbps fixed wireless broadband products. Pricing starts at \$99 per month for dedicated symmetrical internet access and provides the consistency and scalability needed for small business internet access. In addition all turnpipe circuits are capable of carrying enhanced services such as voice, video, and QOS which allows small businesses to leverage their internet infrastructure towards additional cost savings and services specific to their business practices. Delivery of service ultimately comes down to our coverage area, however once confirmed it only takes 7-10 days with easy handoff directly to your network. Get connected today....
